# Welcome !

## Don't miss the train!

Test automation is finally growing up.

# About me

Marcel Veselka

# Testing in change . . .

## 1. Expectations

- Responsibilities
- Skills & competencies

## 2. Organization changes

- Test transformation surges
- Adoption of Agile / DevOps

# Situation in Software Testing

## 3. Market moves

- Merges & acquisitions  
(e2e offerings + market share)
- Open-source vs vendor tools

## 4. Disruption & disruptors

- AI / ML
- Autonomous testing
- RPA

# The key drivers . . . still same?

Quicker

Cheaper

Better quality

.... **Test Automation** might finally solve it

# Current status of Test Automation

Elite DevOps teams perform only  
**10% of Testing Manually**

... not in future  
**NOW !!!**

... so what are the  
**Trends in Test Automation?**

# Trends in Test Automation

## 1. The old ideas

More tools (support API & microservices, simulation)  
Record & play is back!  
Selenium era is over?

## 2. Fixing the pain of scale

Intelligent test execution  
Predictive test selection  
Intelligent maintenance (self-healing)

## 3. AI & ML

AI/ML opportunities in Automation  
Autonomous Test Automation

## 4. Other opportunities

Continuous testing (shift left & right)  
Chaos engineering  
Robotic Process Automation

# 1. The old ideas

- More API & microservices; more simulation
- Record & play is back!
- Selenium era is over?

# Containers, Simulators, Cloud

- Microservices & APIs

- Web & mobile configuration simulators

- Containers & virtualization

- Cloud services

# The new names for old ideas

## Record & play come back

## No-code / low-code test automation

# Record & play come back

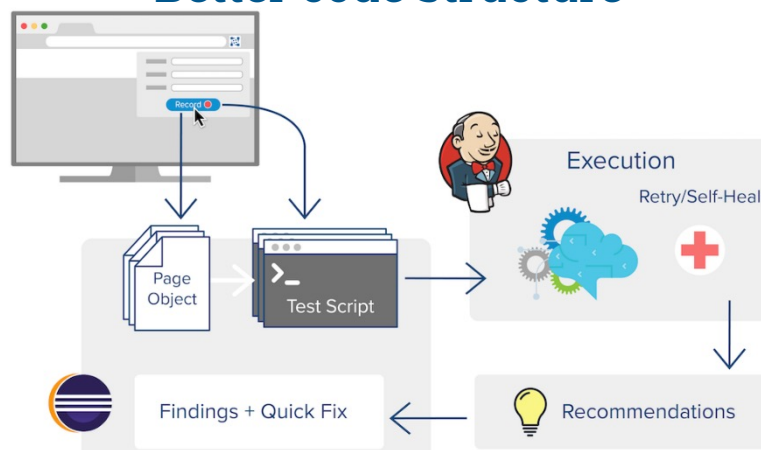

## Example 1: New Selenium IDE

- Better & more complex implementations
- Better stability
- Better Execution
- Extensible with Plugins

## Example 2: Parasoft Selenic

- Self-healing
- Generate (both into existing or newly build projects)
  - Page objects and
  - Better code structure

## • Example 3: TestProject.io

- Both web and mobile
- Self-healing
- Development SDK

**Bonus example:**  
visit the booth at sector A1

# Is the Selenium era over?

**Selenium 4**

<https://cypress.io>

**Cypress.io**

<https://cypress.io>

**Playwright**

<https://playwright.dev/>

**Taiko**

<https://taiko.dev/>

**WebDriver.IO**

<https://webdriver.io/>

## 2. Pain of scale

- Intelligent test execution
- Intelligent maintenance (self-healing)

# Intelligent Test Execution

# Example: Predictive Test Selection

Select subset with highest probability of failure

Launchable

# Self-healing tests

= ability to automatically update scripts / behavior during test execution

# Features of self-healing tests

## 1. Fix locators

Dynamic

Intelligent (powered by AI/ML)

## 2. Assessments

Improved maintenance

- Advanced reporting
- Dynamic assertions

## 3. Code update

Automatic script updates

## 3. AI & ML

- Opportunities in Automation
- Autonomous Test Automation

# AI & ML

## Difference?

If it's written in Python, it's probably ML

If it's written in PowerPoint, it's AI

# My top ~~AI~~ ML Opportunities in Automation

# 1. Execution & Maintenance

- Easier navigation through apps
- Intelligent (UI) interaction, dynamic locators
- Re-execution with self-healing

## Element 1: Intelligent locators, example

### Appium classifier

- ML element type classifier.
- Finds Appium elements
  - Using a semantic label (e.g. "cart" or "microphone" or "arrow")
  - The same labels can be used to find elements with the same general shape
  - Works across different apps and different visual designs

```
@Test
public void testClassifierClient() throws Exception {
    driver.get("https://test.ai");
    List<WebElement> els = classifier.findElementsMatchingLabel(driver, "twitter");
    Assert.assertThat(els, IsCollectionWithSize.hasSize(1));
    els.get(0).click();
    Assert.assertEquals(driver.getCurrentUrl(), "https://twitter.com/testdotai");
}
```

test.ai

We're building the  
future of automated  
testing

Get the latest on AI and software testing  
in our weekly newsletter

SUBSCRIBE

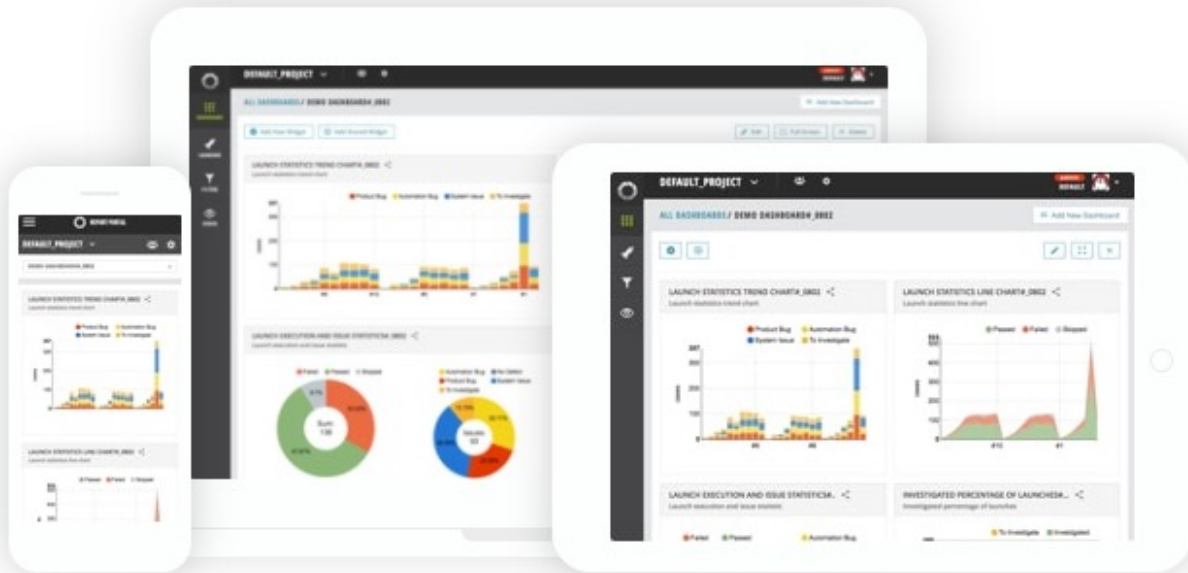

Possible locators:  
css=fa-twitter

# 2. Result Analysis & Reporting

- Identify / classify results from reports
- Predict quality / result based on code changes

# 3. Autonomous testing

... lets finally put all the pieces together !!!

By the end of 2025,  
30% of organizations will  
have implemented an  
**autonomous automation  
strategy**

-- Source: Innovation Insight for Autonomous Testing  
by Gartner, 28 October 2020

**Autonomous testing**  
applies AI/ML based technologies to  
make the testing process  
**independent from**  
**human intervention**

# Test Autonomy Level Definitions

## 0. Manual Testing ("Unassisted")

- Manual exploratory and regression testing physically carried out by people.

## 1. Scripted Automation ("Hands On")

- Handcrafted test automation scripts that can repeatedly execute a test case, sometimes with basic self-healing attributes if the application structure changes.

## 2. Exploratory Bots ("Hands Off")

- Automated semi-intelligent exploration of apps and some measurement of performance/stability without human intervention.

## 3. Human-Directed Regression ("Eyes Off")

- Humans describe the high-level intent of a test case e.g. "Add two items to shopping cart, delete one, and make sure there isn't a crash." Automated machines autonomously decide out how to execute the intent of the regression test case on one or more applications.

## 4. Generative ("Mind Off")

- Machines generate and execute most test coverage across exploration, and regression testing efforts.

## 5. Fully Autonomous ("Human Tester Optional")

- Without human assistance, machines are able to evaluate an application, decide what, when, where and how testing should be performed, and summarize the results for humans (or machines) to make a release/no-release decision based on test results.

# Better automation = autonomous?

Self healing

Deviation  
classification

Image based (UI)  
object recognition

Natural Language  
Processing (NPL)

Predictive test  
selection

Autonomous  
interaction with SUT

Dynamic/magic  
POM

Automatic error  
identification

... and many more

# Better automation = autonomous?

launchableinc.com

QApe

Dynamic/magic  
POM

Applitools

... and many more

## 4. Other opportunities

- Continuous testing (shift left & right)
- Chaos engineering
- RPA

Automate **entire Testing**  
**NOT** just **Test Execution!**  
Even better: automate whole development process.

*// continuous testing: ... integrate testing into your DevOps pipelines*

# Continuous testing in DevOps

*(shift left & right approach)*

- Automate all testing stages
  - Static analysis & scanners
  - Dynamic Testing
    - Test automation
    - Exploratory testing
  - Monitoring & phased (canary) deployment

# Chaos engineering

- Experimenting on a software system in production
- Goal: to build confidence in the system's capability to withstand turbulent and unexpected conditions
- Effective (testing) method for modern microservice architecture
- **Chaos Monkey**: tool invented in 2011 by Netflix to test the resilience of its IT infrastructure

# Robotic Process Automation (RPA)

- Automating processes in production
- Tools we use for test automation could be used in RPA
- Tools: UiPath, Robot framework, Blueprism or RPA Studio

blueprism®

TRICENTIS  
RPA Studio
